1.0 INTRODUCTION

Mehak Realty, LLC is proposing to develop the 2.96 acre site at 64-66 Willimantic Road (Route 6) in Chaplin, Connecticut. The site is located on the western side of Willimantic Road (Route 6) as shown on Figure 1 – Site Location Map. There is an area of inland wetlands on the western side of the site. The wetlands flow to a pipe on the neighboring property and goes to the Natchaug River.

The site is located in FEMA Flood Hazard Zone C (area of minimal flooding) per the Flood Insurance Rate map (FIRM) Town of Chaplin, Connecticut, Windham County, Panel 11 of 20, Community Number 0901790011A effective January 6, 1982. See Figure 2 – FIRMette.

The topography on the site generally forms from the western edge of the existing driveway and flows either to Willimantic Road, western to the onsite wetlands or southerly. Per the Natural Resources Conservation Service (NRCS) Web Soil Survey, soils within the development area are generally classified as soils Merrimac fine sandy loam (Hydrologic Soil Group A) and Hinckley loamy sand (Hydrologic Soil Group A).

The site currently has a vacant house with driveway to Willimantic Road, barn and several dilapidated buildings. Proposed work includes demolition of existing buildings, construction of a new 4,960 SF convenience store, gas pump canopy, diesel pump canopy and associated site work.

2.0 PURPOSE OF REPORT

The purpose of this report is to analyze and quantify the stormwater runoff conditions for the pre-development and post-development conditions and design a stormwater management system to manage the increased stormwater peak discharges.

This report presents the basis of the hydrologic and hydraulic analysis and design for the new stormwater management system in accordance with the Connecticut Department of Transportation (CTDOT) Drainage Manual (Drainage Manual) and the 2004 Connecticut Stormwater Quality Manual (SQM) to the greatest extent practical.

This is an official FIRMette showing a portion of the above-referenced flood map created from the MSC FIRMette Web tool. This map does not reflect changes or amendments which may have been made subsequent to the date on the title block. For additional information about how to make sure the map is current, please see the Flood Hazard Mapping Updates Overview Fact Sheet available on the FEMA Flood Map Service Center home page at <https://msc.fema.gov>.

3.0 ANALYSIS PARAMETERS

Three design points were selected as the analysis points (see Figure 3 – Pre-Development Watershed Map and Figure 4 – Post-Development Watershed Map):

- Design Point #1 is located on the property line along Willimantic Road.
- Design Point #2 is located on the southern property line.
- Design Point #3 is located on the edge of the onsite wetlands.

4.0 BASIS OF DESIGN

The basis of the drainage design is as follows:

1. Maintain overall drainage patterns.
2. Capture, store and infiltrate the runoff volume from the developed areas for the 2 year, 10 year, 25 year and 100 year, 24 hour events.
3. Attenuate post development peak discharge rates for the 2 year, 10 year, 25 year and 100 year, 24 hour events.
4. Stormwater treatment systems are designed to meet, to the greatest extend practical, the water quality goals per the SQM.
5. Building roof drainage systems are designed to convey runoff from a 100 year storm event.

5.0 STORMWATER MANAGEMENT

5.1 Existing Conditions

The site is mostly undeveloped grass, brush woodland with some a vacant house, barn, small buildings and a driveway to Willimantic Road. Existing runoff is directed to three drainage areas.

- Drainage Area DA1 - Approximately 0.14 acres of grass, driveway, part of the house roof, and woods. This drainage area sheetflows to Willimantic Road.
- Drainage Area DA2 – Approximately 1.64 acres of barn, grass and woods. This drainage area sheetflows to the southern property line.
- Drainage Area DA3 – Approximately 0.60 acres of grass, woods and buildings. This drainage area sheetflows to the limit of onsite wetlands.

5.2 Proposed Conditions

Developed DA1

Developed Drainage Area DA1A is approximately 0.11 acres of grass, pavement, and woods that sheetflows to Willimantic Road.

Developed Drainage Area DA1B is approximately 0.89 acres including the new building, new canopies, a portion of the new paved area and landscaped areas. The roof drains from the new building and new canopies will be piped to the new StormTech SC-740 infiltration system. The paved area in this drainage area sheetflows towards Willimantic Road and is collected in catch basins and trench drains then piped to the infiltration system.

The infiltration system in DA1B is designed to remove fine sediment and pollutants and attenuate peak flows for the 2 year, 10 year, 25 year and 100 year storm events. Per the SQM, the infiltration system is based on permeability tests and soil testing performed onsite. The infiltration system uses an infiltration rate of 5 inches/hour, which is less than the range of 36.5 inches/hour to 67 inches/hour (permeability results of TH DD, EE and FF). The bottom elevation of the infiltration system is designed to maintain a minimum of 3 feet from any seasonally high water table per the SQM. An outlet control structure is provided that is connected to an existing catch basin in Willimantic Road.

Pretreatment is provided with the isolator rows in the infiltration system. The isolator row is designed to capture the “first flush” or Water Quality Volume (See Water Quality Calculations in the Technical Appendix). Other pretreatment best management practices include deep sump catch basins.

Developed DA2

Developed Drainage Area DA2 is approximately 0.47 acres of grass and landscaped area that sheetflows to the southern property line.

Developed DA3

Developed Drainage Area DA3A is approximately 0.41 acres of the rest of the new paved area. The runoff from the paved area will be collected in catch basins and piped to a new infiltration system.

The infiltration system in DA3A is designed to remove fine sediment and pollutants and attenuate peak flows for the 2 year, 10 year, 25 year and 100 year storm events. Per the SQM, the infiltration system is based on permeability tests and soil testing performed onsite. The infiltration system uses an infiltration rate of 5 inches/hour, which is less than the range of 14 inches/hour to 50.5 inches/hour (permeability results of TH CC and HH). The bottom elevation of the infiltration system is designed to maintain a minimum of 3 feet from any seasonally high water table per the SQM. An outlet control structure is provided that will outlet to a level spreader then overland flow to the existing onsite wetlands.

Pretreatment is provided with the isolator rows in the infiltration system. The isolator row is designed to capture the “first flush” or Water Quality Volume (See Water Quality Calculations in the Technical Appendix). Other pretreatment best management practices include deep sump catch basins.

Developed Drainage Area 3B is approximately 0.56 acres of grass, landscaped areas and woods that sheetflow to the existing onsite wetlands.

6.0 SOURCE CONTROL AND POLLUTION PREVENTION MAINTENANCE AND OPERATION

Source control and pollution prevention practices for this project are intended to eliminate the generation of pollutants at their source, reduce the types and concentration of pollutants in stormwater runoff and to assure that the BMPs continue to function to remove oil and grease and TSS. The site property managers will be responsible for maintaining the stormwater management system and the goal of this section is to inform managers about system operations.

The following maintenance and operation measures are recommended for source control.

Parking Lots

Parking lots will be swept, at a minimum, in the spring to remove winter accumulations of road sand.

Landscaping

Normal landscaping maintenance shall consist of pruning, mulching, planting, mowing lawns, raking leaves, etc. Use of fertilizers and pesticides will be controlled and limited to minimal amounts necessary for healthy landscape maintenance.

Trees will be fertilized no more than once in the spring with an organic fertilizer. Shrubs and lawn will be fertilized with an organic slow-release fertilizer each spring. Liming of lawn areas to control pH will also be done in the spring if soil testing indicates that it is necessary.

Pesticides will only be used as a control method when a problem has been clearly identified and other natural control methods are not successful. All pesticide applications shall be by licensed applicators, where necessary.

Trash Collection

Trash receptacles service the facility and a dumpster exists on-site. The pickup of trash will occur on a regular basis and all trash will be disposed of legally off-site.

Outdoor Storage

There will be no outdoor storage of hazardous chemicals, fertilizer, pesticides, or herbicides anywhere on site.

Snow Removal & Storage

Snow shall be shoveled and plowed from sidewalk and parking areas as soon as practical during and after winter storms and deposited in snow storage areas on the site or removed.

Catch Basins and Manholes

A Connecticut-Licensed hauler shall pump the sumps of onsite catch basins and manholes, and shall dispose of the sand legally.

For the first three years each catch basin and manhole shall be inspected every four months, with one inspection occurring during the month of April. Any debris occurring within one foot from the bottom of each sump shall be removed by Vacuum "Vactor" type of maintenance equipment. After the first three years the inspection schedule may be adjusted to meet actual operating conditions however, one inspection shall always be conducted in April.

Stormtech SC-740 Isolator row

The isolator row shall be cleaned at the end of construction once the contributing areas are fully stabilized. For the first year of operation following construction, the chamber rows shall be inspected once every 6 months.

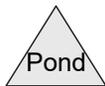

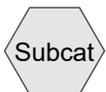

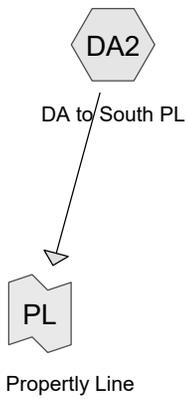

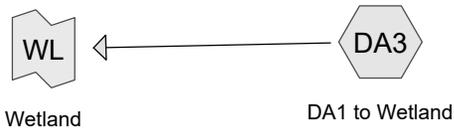

After the first year of operation, the chambers shall be inspected a minimum of once per year. If upon visual inspection it is found that sediment has accumulated, a stadia rod should be inserted to determine the depth of the sediment. When the average depth of accumulation exceeds 3", a clean-out should be performed and properly disposed off-site. Clean-out should be accomplished using a jetvac process.

A detailed maintenance logbook shall be kept onsite for the units by the property owner/manager. Information is to include, but not be limited to, the date of inspection, record of sediment depth, general observations, and date of cleaning performed.

7.0 CONCLUSION

The new site improvements are consistent with the Town of Chaplin Zoning Regulations, Connecticut Department of Transportation (CTDOT) Drainage Manual (Drainage Manual) and the 2004 Connecticut Stormwater Quality Manual (SQM) to the greatest extent practical. The new stormwater management improvements have been designed to attenuate the post-development peak discharge rates for the 2-year, 10-year, 25-year and 100-year, 24-hour storm events at each of the Design Points.

**Appendix D: STORMWATER
MAINTENANCE PROGRAM AND
CHECKLIST**

Stormwater Management System Maintenance Program

There shall be periodic maintenance of the stormwater systems on the property after installation. In order to ensure effective performance of the system, the following stormwater maintenance program has been established. The property owner will be responsible for implementation of this program. A log and schedule of all inspections, cleanings, and repairs shall be maintained by the property owner. All maintenance documents shall be transferred to any future owners upon sale or transfer of the property.

A. Catch basins/manholes

Catch basins are designed with sumps for the purpose of collecting coarse sediment. All catch basins should be inspected two times per year, specifically during times for high levels of maintenance around the site. Sediment should be removed when it extends to within 6 inches of the outlet pipe invert or not less than once per year. Cleanout should be facilitated via vacuum truck or other means that accomplish sediment removal. The sediment shall be disposed of in an approved off-site location in accordance with town and state requirements.

B. Asphalt

Asphalt areas should be swept annually. Ideal sweeping timeframe is in the spring after winter sanding or salting for deicing. Deicing chemicals should be kept to a minimum during the winter months.

C. Subsurface detention systems

Underground detention systems shall be inspected through the surface openings quarterly and sediment/debris shall be removed as needed to ensure proper functioning of structures and inlets/outlets. Areas of disturbance that may be as a result of cleaning shall be seeded and planted in accordance with the original planting plan. Associated structures shall be maintained yearly, or more frequently, as required, by the condition of the site and system. Waste material will be properly disposed of off-site.

D. Lawn and vegetated areas

Vegetated cover shall be maintained on all earth surfaces to minimize soil erosion. Fertilizer use should be minimized and applied using careful application processes.

E. Level spreader

Level spreader shall be inspected quarterly and sediment/debris shall be removed as needed to ensure proper functioning. Concrete sill should be inspected to ensure structural integrity and any signs of failure.

Stormwater Management System Maintenance Checklist

Inspection Date: _____

Inspector: _____
